Legend:

Three dots (...) instead of a figure means that the data has not (yet) been gathered or calculated.

A dash (-) instead of a figure is used for the value absolute zero.

A figure indicated with a superior "p" means that this figure is provisional.

Abbreviations for names of cantons:

These are explained in the table on page 4.

Rounded figures:

In general, figures are rounded up or down, which may cause the sum of rounded figures to differ from the end total.

Dear readers,

While 2018 saw a wealth of events at the FSO, 2019 will also bring a number of changes in terms of statistics, particularly in the field of politics with the federal elections taking place in October. An analysis of the share of the vote of parties and elected members will be published just after the event. In other areas, previously unpublished data on active ageing were disseminated in January as part of the UN programme on population ageing, the Swiss Health Survey 2017 will enable results on alcohol consumption to be published in November and the initial results of the special education statistics will be released in October.

This edition of Statistical Data on Switzerland offers some new features compared with previous editions such as the new statistics on built heritage that were released at the very end of 2018 during the European Year of Cultural Heritage. A distinction is made between historic monuments, archaeology and built heritage sites. You will find the main results in the culture, media and information society chapter. In the industry and services chapter, the new topic of multinational businesses and foreign affiliates is now illustrated by a new graphic, the work and income chapter is enhanced by information on low wages and the mobility and transport chapter now includes passenger transport and more detailed civil aviation data.

Statistical Data on Switzerland is available in printed, electronic and digital format, adapted to mobile devices such as tablets and telephones. In addition to providing the same content as the standard version, the digital format offers extra interactive functions such as maps and graphics. You can see our figures by clicking on certain areas.

We also invite you to visit our website www.statistics.admin.ch where you will find more detailed information on all areas of official statistics in the form of tables, graphics, publications, maps and interactive data that make it possible to create customised tables. The infographics have been updated with the publication of the Statistical Yearbook of Switzerland and illustrate each of the 21 statistical topics.

I hope you enjoy exploring our most recent data on Switzerland and we also invite you to take a look at our Statistical Yearbook of Switzerland that is published every year at the same time as the Statistical Data on Switzerland.

The population is mostly urban

Today (2017), 84.8% of the urban population live in areas with an urban character (urban cores and areas under the influence of urban centres). About half of the population live in one of Switzerland's five largest agglomerations (Zurich, Basel, Geneva, Bern and Lausanne). In 2017, population growth in areas with an urban character was stronger than in areas beyond the influence of urban centres (2017: +1.0% compared with -0.5%).

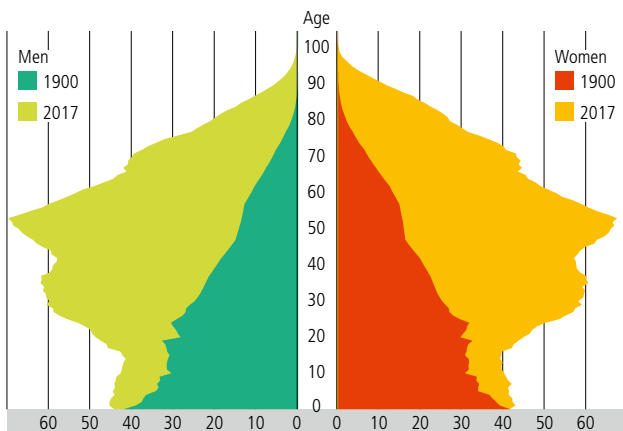

Population growth, 2010–2017

by district

Age structure of the population

Number of persons in '000

Ageing society

During the course of the 20th century, the proportion of elderly people (65 years or older) increased, while that of young people (under age 20) and people of working age (aged 20 – 64) declined. As a result of this process, the shape of the age “pyramid” has been transformed into one of a “fir tree” (2017) in which the baby boom generation (born between 1940 and 1971) predominates. Younger generations, in contrast, are smaller and the ageing of the population will continue. The proportion of persons aged 65 and over is expected to rise from 18.3% (2017) to over 26% in 2045.

Children born alive, 2017

Acquisition of Swiss citizenship

1 Number of citizenship acquisitions per 100 holders of annual and permanent residence permits at the beginning of the year

Foreign population: more than half were born in Switzerland or have been residents for at least 10 years

Foreigners account for 25.1% of the permanent resident population. More than half of the residents without a Swiss passport (55.5%) have lived in the country for 10 years or more or were even born here. In 2017, 44 949 persons (2.3% of the foreign permanent resident population) obtained Swiss citizenship. The foreign population is young: for every 100 foreigners of working age (aged 20–64) there are only 11 aged 65 and over (compared with 37 among the Swiss). 30.0% of children born in Switzerland in 2017 had foreign citizenship. In 2017, the number of immigrations decreased by 10.8% compared with the previous year. Of these immigrants, 57.8% came from EU/EFTA countries.

Increasingly multifaceted living patterns

In 2016, only 28% of private households belonged to the household type "Couple with children". Of the households with at least one child under 25 years, 15% are lone parent families and 5.8% patchwork families. These high figures are the result of a great number of divorces (15 906 in 2017). Furthermore, the proportion of non-marital births doubled between 2000 and 2017, from 11% to 25.2%.

The decision to get married and start a family is being made increasingly late in life: The age at first marriage among women rose from 24 (1970) to 29.9 (2017) and among men from 26 to 32 years; the average age of mothers at first birth rose from 25 to 30.8 years.

The traditional middle-class "single breadwinner" model is now the exception: In 2017, almost eight in ten mothers in couple households were in employment. It still holds true that fathers tend to do more paid work (generally full-time) and mothers are mainly responsible for house and family work.

Private households, 2016

	in '000

² Resident permanent population aged 15 or more and living in a private household

Use of resources and emissions

Index 1990 = 100

A growing population and economy are usually accompanied by a rise in the consumption of natural resources and an increase in emissions – unless behaviours change or technological advances lead to improved efficiency. The volume of municipal waste, for example, tends to grow at roughly the same rate as the gross domestic product (GDP). Greenhouse gas emissions, on the other hand, have remained relatively constant since 1990. Drinking water consumption has even decreased despite the needs of a growing population and economy.

Land use

Period of survey 2004–2009

	km ²	%
Total surface area	41 290	100
Forest and woods	12 930	31.3
Agricultural areas	9 678	23.4
Alpine farmland	5 139	12.4
Settlement and urban areas	3 079	7.5
Lakes and watercourses	1 774	4.3
Other natural space	8 690	21.0

Within 24 years, settlement and urban areas have grown by 23%, mainly at the expense of agricultural areas. According to the latest figures, settlement and urban areas constitute 7.5% of Switzerland's surface area and 4.7% of the surface is sealed.

Change in land use

in square metre per second

Temperature fluctuations

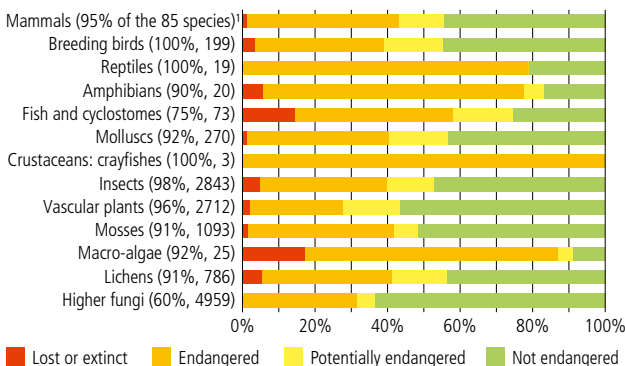

Deviations from long-term mean value 1961–1990, in °C

The air temperature varies from year to year and is characterised by colder and warmer periods. 9 out of 10 of the warmest years in Switzerland since records began in 1864 have been in the 21st century and 2018 was the warmest year so far.

Endangered animals and plants (red lists)

Status 1994–2018, depending on the species group

1 Reading aid: The endangerment status was assessed for 95% of the 85 mammal species. Data are deficient for the remaining species.

There are around 46 000 known species of flora, fauna and fungi in Switzerland. Of the species examined, 35% are on the red list, i.e. they are considered endangered, missing or extinct.

Perception of environmental conditions in the place of residence, 2015

Share of population

In 2015, 24% of the population found traffic noise at home with open windows to be very or rather disturbing. 19% were of this opinion with regard to air pollution surrounding the house and 10% with regard to radiation from power lines or mobile phone antennas. These perceptions approximately correspond to those observed in 2011.

Environmentally related taxes revenue

CHF billion, at current prices

Environmentally related taxes make environmentally damaging goods and services more expensive and encourage consumers and producers to think about the consequences of their decisions. In 2017, environmentally related taxes revenue corresponded to 6.2% of total revenue from taxes and social contributions.

1 As of 1.6.2002 seasonal work permits are no longer issued

Considerable increase in women's participation in labour market

Between 2013 and 2018, the number of women in employment increased at a greater rate than that of employed men (+7.2% to 2.285 million compared with +6.8% to 2.760 million). Part-time employment has also been increasing for many years. In 2018, 60% of women were working part-time (2013: 58.7%). In contrast, 18% of men worked part-time, although this percentage has also increased (+3.5% points compared to 2013). The increase in women's labour force participation and in part-time employment can be attributed to the tertiarisation of the economy. 86.9% of women in employment in 2018 worked in the tertiary sector (men: 67.2%) and part-time employment is mainly found in the service sector (9 out of 10 part-time jobs).

Foreign workers

Foreign workers are an important factor in the Swiss labour market. Since the 1960s, their share of the labour force has always exceeded 20%; in 2017, it was 31%. Foreign labour is particularly important in the industrial sector (2017: 39.1%; Service sector: 29.6%).

In 2017, 78.6% of foreigners in employment were citizens from an EU or EFTA country. Two thirds of the permanent resident population from the EU came from Germany (24%), Italy (20.6%) and Portugal (20.4%).

c = lowest management level; d = no management function

Low wages

In 2016, there were almost 329 000 low wage jobs in Switzerland, i.e. wages below CHF 4335 gross per month for a full-time job (a job is considered to be "low wage" if the wages are less than two thirds of the gross median wage). It should be noted that over time there has tended to be a decline in the proportion of low wage jobs in the economy as a whole from 11.4% in 2008 to 10.2% in 2016. Economic sectors characterised by a high rate of low wage jobs include retail trade (25.7%), the manufacture of wearing apparel (38.9%), the restaurant sector (50.5%) and personnel services (59.1%). In 2016, almost 474 000 persons had low wage jobs and 66.4% of these were women.

The wage gap between women and men

In 2016 the monthly gross median wage of women in the overall economy was CHF 6011 and that of men CHF 6830. The wage gap between women and men was 12.0%. In the private sector in 2016 the wage gap was 14.6% whereas in the public sector it was 12.5%. 57.1% of the wage gap in 2016 (private sector) can be explained by objective factors such as education, age, professional position and economic activity. This leaves 42.9% of the pay gap unexplained. In comparison, the unexplained share of the wage gap in the public sector was 34.8%.

Evolution of nominal wages, consumer prices and real wages

Change compared with the previous year in %

► www.statistics.admin.ch → Look for statistics → Employment and Income

Stable growth of the Swiss economy in 2017

Economic activity in Switzerland in 2017 measured by GDP recorded an increase in growth of 1.6% at previous year's prices identical to the increase of 2016.

This growth is in keeping with a contrasting environment characterised by a marked downturn in the contribution of foreign trade and strong growth in investments in capital goods. Without taking non-monetary gold into account, the balance of goods and services increased by 5.4% in 2017. This downturn compared with 2016 (+12.1%) is due to a deterioration in the balance of services (-2.5%) while the balance of goods (excluding non-monetary gold) continued to grow (+9.4%). Compared with the weak growth in the export of services (+0.7%), the export of goods (excluding non-monetary gold) was more dynamic (+6.2%). The rise in the export of goods was largely from the chemical and pharmaceutical industries.

For the fourth consecutive year, investments showed a marked increase (+3.3%). This rise may be explained by a further increase in investments in capital goods (+4.5%) sustained in particular by R&D expenditure. With regard to the production approach, the value added in the manufacturing industry continued to expand (+4.2%) on the result measured in 2016 (+2.5%). The situation nonetheless remained disparate at economic branch level and many industry sectors still faced difficulties although the chemical and pharmaceutical industries recorded strong growth. Following three difficult years, the value added of banks began to rise again (+2.1%).

Importance of relations with the rest of the world

From 1997, foreign trade played a leading role in the growth of the GDP. In fact, the periods of strong growth have coincided with booming foreign trade. Exports are the component of the GDP which made the largest contribution to growth during the lean years (1997 to 2000 and 2004 to 2007). One of the consequences of the dynamism of exports was an increase in the share of the foreign contribution (balance between exports and imports) to the GDP, showing the growing significance of the rest of the world to the Swiss economy. In 2009, however, Switzerland suffered the brunt of the slowdown in the global economy, which resulted in a negative contribution by foreign trade to growth.

Since the financial crisis of 2008, foreign trade's contribution to growth in GDP has become more erratic. In 2017, this contribution was a positive one. The GNI registered an increase of 1.8% (2016: -0.6%). This

trend mainly results from the larger decline in property income paid abroad (-5.9%) compared with the decline in income received from abroad (-1.6%). The decrease in property income paid and received from abroad can be explained in both cases by the marked decline in income from direct investment.

Share of the external sector in GDP
at current prices

GDP and GNI at current prices
in CHF billion

Once economic activity measured by GDP is known, one can investigate the efficiency with which productive resources (labour and capital) are utilised. Labour efficiency is measured by hourly labour productivity, i.e. the value added created by hour worked.

More than 99% of enterprises are SMEs

More than 99% of all enterprises in Switzerland are small and medium-sized enterprises (SME) i.e. enterprises with fewer than 250 employees. The proportion of micro-enterprises (with fewer than 10 employees) in 2016 is larger in the service sector than in the secondary sector (90.7% compared with 80.0%). The average size of enterprises also differs accordingly (service sector: 7.2 employees; secondary sector: 12 employees). Over two thirds of employees work in SMEs; around one third in large enterprises (with fewer than 250 employees). Slightly more than a fourth of jobs (26.2%) are accounted for by micro-enterprises and over a fifth (21.5%) by enterprises with 10 to 49 employees. In 2016 the share of total employment represented by the tertiary sector in the case of private enterprises was 71.9%. Overall in private enterprises nearly 1 580 000 employees worked in the primary sector, 1 083 000 in the secondary and 3 173 500 in the tertiary. The healthcare and retail sectors counted the most employees in private enterprises (397 300 and 345 400 employees respectively).

Production in the secondary sector

Indexed change in the quarterly results
Annual average 2010=100

Overall production in the secondary sector (industry and construction) grew by 26.1% between 2004 and 2017. The trend is highly cyclical. Furthermore, the Swiss economy was hit by the financial crisis in 2007 and in 2015 by the Swiss National Bank's decision to abandon the minimum euro exchange rate. This decision meant that Swiss products became more expensive for foreign purchasers and led to a decline in turnover for the mainly export-oriented industry. Whereas in 2015 nearly all sectors made losses in production compared with the previous year, in 2016 the situation improved. In 2017, almost all sectors recovered resulting in an increase in secondary sector production (+4.4%).

Employment

From 2004 to 2017 the number of secondary sector jobs (excl. construction) rose by 1.6%. Between the 1st quarter 2006 and the 3rd quarter 2008, employment growth was strong. With the financial crisis came a slump in the labour market: by the 1st quarter 2010 the number of jobs had fallen to the level of the 4th quarter 2006. By mid-2012 industry had recovered somewhat only to undergo further decline. Until the 2nd quarter 2013 and again in 2015 and 2016 the number of jobs fell slightly. From 2004 to 2017 employment in construction rose by 16%. During the same period the number of tertiary sector jobs (excl. construction) rose by 20%. Particularly strong growth was seen between 2006 and 2008 and from 2011 to 2013.

Retail trade

After years of strong turnover (2002–2008), in 2009 in the wake of the global financial crisis, Swiss retail trade suffered from a slight decline. The increasingly small rises in turnover in the following years came to an abrupt end in 2015 due to the revaluation of the Swiss franc against the euro and the subsequent price increases of Swiss products which in turn led to greater numbers of Swiss consumers making their purchases abroad. The fall in turnover continued in 2017, although to a smaller extent.

The agricultural and alpine agricultural areas together make up 36% of the total area of Switzerland. The number of farms is generally decreasing although the actual farms are getting bigger and the organically farmed area is increasing. Animal production is the predominant branch of farming. Forest and woodland account for 31% of Switzerland's territory. The forest area has notably increased in the Alps. Two thirds of trees are coniferous. In 2017, 4.7 million m³ of timber was harvested. The landscape is therefore largely shaped by agriculture and forestry. In 2017, the share of agriculture and forestry in the gross value added of the Swiss economy was 0.7%.

Total energy use and final consumption, 2017

1 Excl. import surplus of electricity (1.8%)

Increased consumption

Final energy consumption is closely linked to economic development and population growth. Increasing numbers of inhabitants, larger dwellings, growing production, rising consumerism, heavier motor vehicles etc. lead to increased energy consumption unless this is compensated for by greater energy efficiency. In 2017, transport was the largest consumer group with around 36% of the final energy consumption. 64% of the final consumption were covered by fossil fuels and 22.3% came from renewable energies, mainly hydropower.

1 As of 1 June following year

2 As of 2009 the housing stock is calculated on the basis of the Buildings and Dwellings Statistic (BDS)

The single-family house remains the most important building category

Single-family houses as a percentage of total building stock rose from 40% to 57% between 1970 and 2017. In contrast, the number of newly built single-family houses in 2017 fell by 4.9% compared with the previous year.

Continuous increase in the home ownership rate since 1970

At the end of 2017, 38.0% of households in Switzerland lived in their own dwelling. This corresponds to 1 413 352 households. Since 1970 the home ownership rate has risen continuously (1970: 28.5%, 1980: 30.1%, 1990: 31.3%, 2000: 34.6%). The number of dwellings in condominium ownership has shown the greatest increase. Their number rose from 237 716 to 445 559 between 2000 and 2017 (+87%). However, the majority of privately owned dwellings continue to be composed of households who own the house in which their dwelling is located (2000: 809 731, 2017: 967 793).

Transport infrastructure

Switzerland's transport infrastructure is well developed in international comparison. It covers 2% of Switzerland's territory and almost a third of its settlement and urban areas. Apart from roads and railway lines, there are also 127 km of cog railway lines, 327 km of tramlines and almost 1000 km of cable cars across Switzerland. In air traffic, the three national airports (Zurich, Geneva and Basel) connect Switzerland to European and global centres and a total of eleven regional airports are primarily used for business, tourism and work aviation.

Air passengers: scheduled and charter traffic 2017

Passengers arriving and departing, in 1000

Total airports	54 912
Zurich	29 361
Geneva	17 260
Basel-Mulhouse	7 869
Regional airports	422

In 2017, Swiss airports registered 0.5 million take-offs and landings in scheduled and charter flights and 54.9 million passengers (local and transfer passengers). While the number of flight movements for scheduled and charter flights has decreased by 13% since 2000, passenger numbers have increased by 60%. These opposing trends are due to larger aeroplanes and higher seat load factors.

The three tiers of the social security system

Social security in Switzerland is based on a three-tier system:

In addition to individual means of subsistence, the first tier includes the coverage of basic needs. It is available to everyone and includes the education and legal system as well as public security.

The second tier includes all social insurances and is intended to cover risks associated with old age, illness, disability, unemployment and maternity.

The third tier includes social assistance in a broader sense. Economic social assistance, also called social assistance in the narrow sense, is the last level in the social security system. It is only called upon when other benefits such as social insurances are unavailable or are exhausted. Furthermore recipients must be in a situation of need and it is only paid to persons in modest financial situations.

Before social assistance is solicited here, a series of means-tested social benefits are available in the third tier, aimed at avoiding dependence on economic social assistance. These include supplementary benefits, advance alimony payment as well as cantonal housing benefits, family benefits, unemployment assistance and old-age and disability benefits.

Total expenditure on social security

In 2016, total expenditure on social security amounted to 185 billion francs. 170 billion can be attributed to actual social benefits. About four fifths of these are spent on social insurances (the second tier of the social security system).

Health insurance

The average annual cantonal premiums per insured person for the compulsory health insurance rose from CHF 2091 (2002) to 3605 (2017). In 2017 the average annual premium was CHF 4224 for adults, CHF 3724 for young adults and CHF 1103 for children. Great differences can, however, be observed between cantons. In 2017 the average annual premium was CHF 4812 in Basel Stadt and CHF 2633 in Appenzell Innerrhoden.

Rising expenditure on social assistance

In 2016, net expenditure on social assistance in the broader sense totalled CHF 8.2 billion, i.e. approximately CHF 208 million more than in the previous year (+2.6%). About 60% of this expenditure went on supplementary benefits relating to OASI and IV (CHF 4.9bn), and another third on social assistance in the narrow sense (CHF 2.7bn). The remaining benefits belonging to social assistance in the broader sense (old age and disability benefits, unemployment assistance, family benefits, advance alimony payments and housing benefits) together accounted for just 6.8% of expenditure.

At CHF 972 per capita, the average annual expenditure for social assistance in the broader sense was 1.4% higher than the previous year. Expenditure for social assistance in the narrow sense by beneficiary rose by 1.0% from CHF 9859 in 2015 to CHF 9961 in 2016.

The cantons were the principal disbursers of social assistance in the broader sense. In 2016 they bore 44.6% of net expenditure, 36.8% was borne by the communes and 17.9% by the Confederation.

Net expenditure on means-tested social benefits

In CHF billion (current prices)

Social assistance beneficiaries

In 2017, 278 345 persons, 3.3% of the total population, were supported by social assistance. There are considerable regional differences: the highest rates are found in larger and medium sized towns with a distinct inner-city character. Groups of persons who are to a greater degree dependent on social assistance are over-represented in these towns. This includes for example, single parents, foreigners and the long-term unemployed.

The risk of becoming reliant on social assistance varies greatly depending on a person's age, family structure and nationality.

Social assistance rates are highest among children and young people under 18. In general, rates tend to diminish with increasing age. They are lowest (social assistance rate 0.2%) among persons aged 65 and over, who receive support when needed from the OAS supplementary benefits.

Life expectancy

Life expectancy has shot up during the last century, largely as a result of falling infant and child mortality. Life expectancy has also continued to increase in recent years. Since 1991 it has risen for women by 4.2 years and for men by 7.3 years (2017). Men tend to die earlier (before the age of 70), in particular due to accidents and acts of violence, lung cancer as well as ischaemic heart disease.

Self-rated health, 2017

In 2017, 86% of men and 83% of women described their health as good or very good and only 4% of men and women qualified it as bad or very bad. However, temporary physical and mental problems seem to affect work and everyday life. Swiss inhabitants were unable for health reasons to go to work for an average of 8 days in 2017.

Consumption of alcohol, tobacco and illegal drugs, 2017

Illegal drugs are mainly used by teenagers and young adults. In 2017, approximately 12% of 15–39 year-olds consumed cannabis. Much more serious from the public health angle is the consumption of tobacco and alcohol. About 27% of the population as a whole smoked at the time of the survey in 2017: 23% of women and 31% of men. The percentages have fallen slightly compared to 1992, but in comparison with the 2012 Health Survey, they have remained stable. The percentage of people drinking alcohol every day has fallen to 11% (1992: 20%). 15% of men and 7% of women consumed alcohol on a daily basis.

Health care costs

In 2016, 12.2% of the GDP went on health (1990: 8.3%). Development of supply is a fundamental factor in this increase: e.g. expanded facilities, growing specialisation and greater use of technology and greater comfort. The impact of the ageing population is not so significant.

Moving towards a Swiss educational system

Switzerland's education system is characterised by strong federalism. The diversity of the different education systems is particularly noticeable in compulsory schooling: depending on the canton, in lower secondary schools, there are two, three or four different performance levels.

The Swiss education system is changing. Along with the harmonisation of compulsory education, children will be expected to attend school for eleven instead of nine years. In most cantons, attendance at the previously optional pre-school level is now compulsory. In the last two decades, the national structures have also been reformed beyond compulsory education (introduction of the vocational Matura and the universities of applied sciences as well as the implementation of the Bologna reform). These reforms are also reflected in increasing demand for education.

1 Including universities for teacher education

The gender gap has narrowed

Women have been the main beneficiaries of the educational boom in recent decades. Today almost as many women as men undertake and complete post-compulsory education or vocational training. Whereas the gender ratio in the universities and universities of applied sciences is now almost even, men are still more likely than women to complete higher vocational education. Accordingly, on average men still remain longer in education than women. Conversely, girls are more successful in compulsory education: they are transferred to a special class less frequently and at the lower secondary level they attend schools with higher educational requirements.

Particularly striking differences still exist in the choice of subject area. This applies to both vocational training and university. Job sectors are dominated by either men or women, not least due to traditional role models. In the industry and handicrafts sector, men predominate; in the retail, health and personal care sectors, women are in the majority. At the university level men still tend to opt for technical, scientific and business fields, while women choose the humanities, social work and the arts.

Increased participation in education

Over the past thirty years the participation in education at upper secondary level and especially at tertiary level has risen considerably. Educational courses giving access to universities are particularly concerned. The percentage of people taking the Matura examinations for example (vocational Matura and academic Matura) rose from 25.7% in 2000 to nearly 40% in 2016 (including specialised Matura). The number of students at higher education institutions more than doubled between 2000 and 2016. This is in no small part due to the establishment of the universities of applied sciences and teacher education.

In accordance with this development the educational level of the Swiss population is expected to rise considerably in the coming years. The percentage of persons with a tertiary-level qualification in the population groups aged 25–64 is expected to rise from 40% in 2014 to 50% by 2027.

Further education

The majority of the population in Switzerland (nearly 80% of the permanent population aged 25–64) undertook further education in one form or another in 2016. It appears that the integration in the labor market and the level of education are positively associated with participation in continuing education courses.

Focus on research

Research and development (R&D) is an important factor for a national economy. With 3.4% of its GDP being spent in this area (2015), Switzerland is one of the most R&D-oriented countries in the world.

In 2015 around CHF 22 billion was spent on domestic R&D. Of this, around 71% was in the private sector, 27% in universities and the remaining 2% was divided between the Confederation and various private, non-profit organisations.

In 2015 the corresponding expenditure by the private sector abroad amounted to CHF 15.3 billion, almost as high as the inland expenditure of CHF 15.7 billion.

The Swiss press in upheaval

The market for daily newspapers has changed fundamentally since the turn of the century. In German-speaking Switzerland, the free newspaper “20 Minuten” has become the largest daily with 1.3 million readers per edition. In French-speaking Switzerland, “20 minutes”, with 496 000 readers, is also the most widely read title. In Italian-speaking Switzerland, a newsstand newspaper, the “Corriere del Ticino”, is still the leading daily (98 000 readers). However, “20 minuti”, which was launched 2011, already has almost 92,000 readers.

Internet and mobile telephony

Towards the end of the 20th century, the upsurge in mobile telephony preceded that of the internet, before the shift to mobile internet took place. The number of mobile phone lines increased from 0.1 million in 1990 to 11.1 million at the end of 2017, equating to 131 lines per 100 inhabitants. While the number of regular internet users (those who use the internet several times a week) aged 14 years and over was 0.7 million in 1998, this figure was 5.8 million at the beginning of 2018. The convergence can be clearly seen in the rapidly growing number of mobile phone contracts enabling internet access. The number of users rose from 3.4 million in 2010 to 8.4 million in 2017. E-commerce is in the midst of a boom: the number of people making at least one online purchase in the last 12 months has increased by 50% since 2010 reaching 4.9 million in 2017.

The ten largest libraries

In 2017, the ten most important libraries measured by their holdings had collections totalling about 56.9 million copies.

Historic monuments and museums

In 2016, around 75 000 historic monuments across Switzerland were protected. Almost 4% of these were monuments of national importance, while the remainder were of regional or local importance. Nearly one in ten protected monuments was a scared structure. In 2017, there were 1111 museums in Switzerland. These were home to a total of 71.3 million works and other objects and they generated 13.5 million admissions.

Spending on culture and media by private households

In 2016 approximately CHF 15.5 billion was spent on culture and media. This is equal to an amount of CHF 354 per month and per household and a share of 6.7% of total consumer spending. At 85% or CHF 13.2 billion, spending on the media – e.g. on newspapers, books, television and internet subscriptions (combined subscriptions included) as well as receiving and recording devices – accounted for the bulk of all cultural expenditure. Leaving media spending to one side, at CHF 705 million, the greatest expenditure goes to theatre and concerts.

Cultural funding by the public sector

In 2016, about a fourth of total public spending on culture by the Confederation, cantons and communes, i.e. CHF 752 million, went to the sector “concerts and theatre”. Some CHF 601 million was spent on the “Museums and Fine Arts” sector. This was followed by the sectors “Libraries”, “Preservation of Monuments and National Heritage”, “Mass media” and “Film and cinema”, with contributions ranging from CHF 377, CHF 266, CHF 140 to CHF 70 million.

Film and cinema in Switzerland

In the early 2000s, approximately 1300 films were shown every year in Switzerland. Today this number is about 1900. During the same period, the share of Swiss films has increased from around 10% to 15%. The box office market share of Swiss films has been approximately 5% on average since 2000.

The political system

The Swiss Confederation, today made up of 26 cantons, has been in existence since 1848. The Government (Federal Council) is a collegial body consisting of 7 members (from 2016: 2 FDP, 2 SP, 2 SVP, 1 CVP). They are elected by both chambers in parliament: the National Council (representing the people, 200 seats) and the Council of States (representing the cantons, 46 seats). The Swiss political system is also characterised by far-reaching democratic rights (initiatives and referendums) and popular votes.

National Council Elections 2015

There were two winners of the national council elections in 2015: with a considerable increase in votes, the Swiss People's Party (SVP/UDC) which showed the greatest electoral strength (29.4%) achieved by a party since the first proportional representation vote in 1919 and secondly, the Radical Democratic Party/The Liberals (FDP/PLR) which increased its share for the first time since 1979. Losses were registered by the new centre parties, the Conservative Democratic Party (BDP/PBD), the Green Liberal Party (GLP/PVL) and the Christian Democratic People's Party (CVP/PDC) which reached a record low level. The trend observed from the 2011 national council elections – in which the emerging new centre parties (GLP/PVL, BDP/PBD) brought about a reduction in political polarisation – came to a halt and was, to some extent, reversed.

Participation rate in national elections and referendums

1 These are average values for referendums that took place within two years before and two years after the respective National Council elections. Until 1931, within one and a half years before and one and a half years after the elections, in accordance with the three-year cycle that was the norm at that time.

National participation in referendums and elections

While voter participation stood at 80% in the 1919 National Council elections, this was followed by a continuous decline reaching a temporary low of 42% during the 1990s. Since then a slight recovery has been observed with 48% of voters participating in the 2015 National Council elections. In contrast, voter participation in national votes has been influenced by considerable variations due to the different referendum proposals. While voter participation in national votes was on the decline in the 1980s it has since stabilised. It even increased slightly in 2018 at 44% compared with the 1990s (43%) and 1980s (40%).

Public debt

The public spending ratio measures the expenditure of public authorities expressed as a percentage of gross domestic product (GDP). It includes expenditure by the Confederation, the cantons and communes as well as public social insurance funds.

Despite a considerable increase since 1970, in international comparison Switzerland is in a good position: it has one of the lowest public spending ratios of all OECD countries. Most European countries register markedly higher public expenditure.

Public spending ratio in % of GDP

Switzerland's public debt ratio according to the Maastricht definition is also relatively low compared with other OECD countries; between 1990 and 2003, however, it rose continuously. Thanks to a strong economic recovery until 2008, together with the shedding of surplus gold reserves of the Swiss National Bank as well as various structural measures (i.e. relief programmes, debt and expenditure brakes), the reduction of public debt was possible on an ongoing basis from 2005 to 2011. In 2012 debt temporarily increased slightly and then subsequently fell again from 2015 onwards. At the end of 2016, the debt rate was 29%.

Crime figures offer only a limited reflection of the reality of criminal behaviour: On the one hand, criminal standards and sanctions are affected by changes in society and on the other, crime figures are also strongly influenced by manpower resources, prosecution priorities, the efficiency of the police and justice system and the population's readiness to report crime. It is generally hard to determine which causes are responsible for changes in crime figures and to what extent.

Crime reporting

In 2017 the following number of offences were recorded in the Police Crime Statistics: 439 001 under the Swiss Criminal Code (SCC), 80 074 under the Narcotics Act (NarcA) and 38 054 under the Foreign Nationals Act (FNA). The detection rate for homicides was 95%, for property offences 22%.

With regard to domestic violence, 17 024 offences were recorded. Half of these offences were committed within an intimate relationship. The breakdown by nationality and residence status shows that offenders were of Swiss nationality in 48% of Criminal Code offences and 56% of Narcotics Act offences. Foreigners with residence constituted 31% and 23% of offenders. This means that a substantial part of foreign delinquency is "imported", namely 21% (Criminal Code) and 22% (Narcotics Act). For offences against the Foreign Nationals Act, 83% of offenders were non-residents.

Offences according to Criminal Code titles 2017

Convictions

Whereas in the mid-1980s, slightly more than 45 000 convictions against adults were registered, this number has now more than doubled and in 2016 was approximately 105 000. Depending on the law under which the conviction was made, the trend varies greatly. Since reaching an all-time high in 2013, a decline of 15% has been recorded for crimes against the Swiss Criminal Code. With regard to the Road Traffic Act (SVG), ever increasing road traffic checks have led to more cases with convictions over a longer period. Conviction figures have however decreased since 2014. The number of convictions against the Narcotics Act have been stable for several years. Convictions for crimes against the Foreign Nationals Act have fallen by 12% since 2013 reaching 17 000 in 2017.

Selected offences SCC

1 Threat, coercion, trafficking in human beings, deprivation of liberty and abduction, hostage taking, unlawful entry

Selected offences RTA

1 Art. 90.2 RTA
2 Over the legal alcohol limit (Art. 91 Para. 1, Part 2 RTA)

Juvenile convictions

Convictions of minors showed a clear decline between 2011 and 2012 (-19%). There has been quite an upward trend as concerns offences under the Narcotics Act. The number of thefts and serious violent crimes have considerably decreased.

Imprisonment

In Switzerland in 2017 there were 106 (mostly small) prison establishments with a total of 7468 detention places. On the reference day of 6 September 2017, 6863 persons were in detention. Thus, the total occupancy rate was 92%. Of the 6863 inmates, 69% were serving custodial sentences, 24% were in pre-trial detention, 4% were in detention subject to coercive measures under the Foreign Nationals Act, and the remaining 3% were detained for other reasons.

Prison population by sentence type

Recidivism

The reconviction rates of adults convicted in 2013 for crimes and less serious offences, over an observation period of 3 years (i.e. until 2016) was 20%, for minors.

► www.statistics.admin.ch → Look for statistics → Crime and criminal justice

Composition of gross income by household type, 2012–2014

Household budgets: Income

Averaged out over all households, income from employment at 76% represents the main component of household income. The second important component consists of pensions from the first and second pillars of the Swiss pension system and other social security benefits at 19%. The remainder of household income is made up of income from assets and transfers from other households.

The picture becomes more differentiated when the composition of household income is considered by household type. This shows, for example, that in households aged 65 and over, pensions represent the major part of the household income, but income from employment and, in particular, income from assets play a relatively important role. Transfers from other households represent an important source of income only in specific types of households, such as single-parent families, where the average amounts to 12%.

Household budgets: Expenditure

The variations in the composition of spending are less pronounced. Compulsory deductions, which comprise 29% of gross income, are the largest item. In the area of consumer expenditure, the largest item is expenditure on housing at 15%. Other large items include expenditure on food and non-alcoholic drinks, on transport and on entertainment, recreation and culture.

After all expenditure has been deducted, on average 14% of the gross income is left for saving. There are significant differences in this area depending on household type. Households over the age of 65 on average save less than younger households. Sometimes this figure is even a minus, which means that these households are living on their capital, among other things.

Composition of household budget, 2012–2014

¹ Taxes, social insurance contributions, basic health insurance premiums, transfers to other households
² Less sporadic income

Household expenditure over time

The composition of household expenditure has changed significantly over time. These changes are considerably larger than the differences between households today. For example, the share of total expenditure represented by expenditure on food and non-alcoholic drinks in 1945 was 35%, but nowadays this has fallen to 7%. In contrast the proportion of other expenditure has increased, such as expenditure on transport, which has risen from around 2% to 8%.

Trends in selected household expenditure items

Availability of selected consumer goods, 2016

Availability of consumer goods

Information about the availability of a selection of durable consumer goods shows that households in Switzerland are very well-equipped with IT hardware. A total of 93% of people live in a household with a computer and 98% in a household with a mobile phone. These proportions are continuing to rise: in 1998 only 55% of people lived in a household with a computer.

In the case of household appliances, such as dishwashers, washing machines and tumble dryers, there has also been an increase. In 2016 more than 90% of the population lived in a household with a dishwasher, while in 1998 the figure was only 61%.

Material deprivation rate by various socio-demographic characteristics, 2016

Material deprivation

The reasons for not owning a durable good are not necessarily financial. In 2016, less than 2% of people living in Switzerland went without a computer for financial reasons; as far as owning a car for private use is concerned, this percentage was almost 6%. One of the most common material deprivation is caused by a lack of financial reserves. 22% of the population living in private households did not have the means to meet unexpected expenses of CHF 2500. This is followed by deprivation which affects the perceived inconveniences with regard to the residential environment. 18% of the population say that they are exposed to noise from neighbours or the street, 11% are confronted with problems of crime, violence or vandalism and 13% with a too wet accommodation. In addition, 9% of the population could not afford a week's holiday away from home each year.

Monetary poverty and risk of poverty

In 2016, 7.5% of the permanent resident population in private households in Switzerland was affected by income poverty. This corresponds to approximately 615 000 persons. The average poverty threshold, based on the social subsistence level, was CHF 2247 per month for a single person and CHF 3981 per month for two adults with two children. According to the relative at-risk-of-poverty concept, 14.7% or some 1 202 000 persons were at risk of poverty. The risk of poverty's threshold for a single person was CHF 2483 per month for a single person (60% of the median of the equivalent available income) and CHF 5214 for two adults with two children.

Poverty of employed persons

People living in households with high labour participation tend to have the lowest poverty rates. Successful integration in the labour market generally offers effective protection from poverty. Nevertheless, in 2016 some 3.8% or approximately 140 000 individuals were affected by poverty despite being in employment.

The phenomenon of working poverty is best understood in relation to the (longer term) security and insecurity of the employment situation. If working conditions and methods can be considered as clearly or tending to be insecure, the risk of poverty is greater.

Risk of poverty rate¹ by various socio-demographic characteristics, 2016

¹ Based on the income without considering any assets
² Persons in a household with these characteristics

Poverty rate¹ by various socio-demographic characteristics, 2016

1 Based on the income without considering any assets
 2 Persons in a household with these characteristics

Inequalities in income distribution

Inequalities in income distribution are assessed on the basis of equivalised disposable income. This is calculated as follows: A household's compulsory expenditure is deducted from the household's gross income; the resulting balance is divided by the equivalent size of the household. Thus the equivalised disposable income acts as an index of people's standard of living, regardless of the type of household in which they live. In 2016, the equivalised disposable income of the wealthiest 20% of the population was 4.2 times greater than that of the poorest 20%.

2030 Agenda goals monitoring

The United Nations' 2030 Agenda constitutes a new worldwide reference framework, which steers the activities of Switzerland in the area of Sustainable Development. The MONET indicator system was extended in order to monitor the achievement of the 17 goals of the 2030 Agenda. Twenty-three particularly significant indicators have been designated as key indicators. Seventeen of them, one per objective, are presented below.

Assessment:

- Positive (towards the goal of sustainable positive development)
- Negative (against the goal of sustainable development)
- Unchanged

-    Targeted trend
-    Observed trend

Goal 1: No poverty No significant change in the poverty rate	  
Goal 2: Zero hunger The nitrogen balance from agriculture decreases	  
Goal 3: Good health and well-being The number of potential years of life lost are decreasing	  
Goal 4: Quality education Teenage reading skills are improving	  
Goal 5: Gender equality The wage gap between women and men is gradually narrowing	  
Goal 6: Clean water and sanitation No significant change in the amount of nitrate in groundwater	  
Goal 7: Affordable and clean energy The part of renewable energies in relation to final energy consumption is increasing	  
Goal 8: Decent work and economic growth No significant change in the percentage of young people neither in employment nor in training	  
Goal 9: Industry, innovation and infrastructure Material intensity is decreasing	  
Goal 10: Reduced inequalities The income distribution between the richest and the poorest has not changed significantly	  
Goal 11: Sustainable cities and communities No significant change in the proportion of housing costs in the poorest families budget	  
Goal 12: Responsible consumption and production Total production of municipal waste is increasing	  
Goal 13: Climate action The decrease in greenhouse gas emissions does not fully correspond to the decline required to fulfill the intended target	  
Goal 14: Life below water The total nitrogen load in the Rhine in Basel is decreasing	  
Goal 15: Life on land The populations of breeding birds at risk of extinction are on the decrease	  
Goal 16: Peace, justice and strong institutions The number of victims of serious violent offences is decreasing	  
Goal 17: Partnerships for the goals Official development assistance is rising

2019 Statistical Yearbook of Switzerland

The Statistical Yearbook of Switzerland is the standard reference work on Swiss statistics. It provides a comprehensive picture of Switzerland's social and economic situation and contains, along with numerous tables, illustrated overviews of all themes of public statistics. The whole yearbook is published in German and French; in addition, a cross-section summary with the most important statistical information is available in English and Italian. The latest results from the land use statistics are shown in map form in a separate chapter.

Published by the Federal Statistical Office. 672 pages (hardback), CHF 120. Available from bookshops or directly from NZZ Libro. Email: nzz.libro@nzz.ch

Graphical Statistical Atlas of Switzerland 1897–2017

In 1897, when statistics was still in its infancy, the Federal Statistics Bureau published its 'Graphical and Statistical Atlas of Switzerland', a real highlight of graphic representation at that time. It was Switzerland's first atlas, presenting several topics in one volume. This impressive work, which gives an insight into the realities of Swiss society at the end of the 19th century will also be honoured on the occasion of the Statistical Yearbook's anniversary, as the Federal Statistical Office has decided to publish a reproduction of this work as an appendix to the 2018 Yearbook, enriched with some of the latest maps.

Published by the Federal Statistical Office. 64 pages (hardback), CHF 34 (excl. VAT). The Atlas can also be ordered separately. Available at the Federal Statistical Office. Email: order@bfs.admin.ch

All FSO's statistics available online can be accessed via the Swiss Statistics responsive website www.statistics.admin.ch: press releases, continuously updated results in the form of indicators, graphics, infographics, tables and interactive data cubes as well as maps and atlases produced by the FSO. Data is listed under the heading "Catalogues and Databases" under "Look for statistics". The website is available in German, French, Italian and English, with some content also in Romansh.
